Technical Characteristics of Gauze

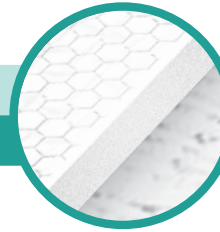

Thickness and Types

GAUZE THICKNESS

STANDARD

with NON-STICK LAYER

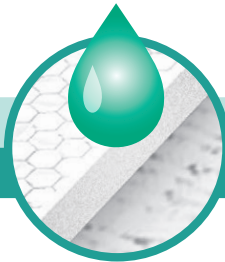

HIGH THICKNESS

with NON-STICK LAYER

Compared to standard gauze, it is twice as thick and absorbs three times as much.

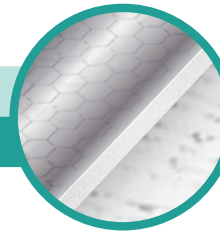

Different Kinds of Gauze Available

ANTISEPTIC

Pure cellulose gauze

The antiseptic gauze pad with chlorhexidine digluconate prevents and fights infections by controlling the wound's microenvironment. Tests conducted on the gauze have demonstrated its antiseptic properties, highlighting its effectiveness after just 1 hour.

with ALUMINUM LAYER

Viscose Gauze

Indicated for abrasions and mild burns.
The aluminum layer creates a barrier effect that allows the restoration of optimal conditions for the healing process. It does not adhere to the wound.

HEALING with Hyaluronic Acid

Viscose Gauze

HYALURONIC ACID creates hydration conditions to support the healing process. It protects the wound from external elements, promotes the natural tissue repair process, reduces the risk of infection, and prevents scar formation.

Soothing, Moisturizing, with ALOE VERA

Viscose Gauze

ALOE VERA infused in the gauze is a well-known emollient, soothing and natural moisturizer. It promotes the tissue regeneration process, ensuring optimal conditions for wound microenvironment control and supporting natural healing.
